C-3115

- Extended security
- A single handset does it all!

NEW!

COBS C-3115 – For total control

Colour-coded alarms improve management

C-3115 has easy access buttons and a large, clear screen that can display an informative status list. Alarms and messages are prioritized and sorted by importance and colour, with the most urgent alarm at the top, giving a clear, quickly understood view of the whole environment and enabling appropriate action.

Automatic alarms for harsh environments.

The need to support lone workers is increasing in many industries and trades. The C-3115 increases the safety and security of those who face the risk of accidents, threats or violence while at work. The handset provides automatic alarms if you fall, remain stationary for an unusual time, start running or if someone snatches the handset from you and when it tilts.

The C-3115 is a smart handset that can handle almost everything.

System integration

C-3115 can be integrated with complex alarm systems, for example, fire alarms, building, operation and access control. The result is increased efficiency and more flexible staff – saving both time and money.

Extremely robust and a 3 year warranty

Psychiatric units, high security, custodial and other secure units are vulnerable work places requiring the high levels of security, quality and reliability that the C-3115's advanced technology provides.

The C-3115 is developed in Sweden especially to operate reliably for several years. The handset has a robust and durable design with a rubberised casing for optimal grip. It is drop tested, water and dust resistant in compliance with the IP65 classification.

Large, easily accessible alarm button

The alarm button at the top of the handset is easily accessible to call for help quickly when needed. On the right side of the handset is an extra function key for 'soft' pre-set alarms.

Location and positioning

The C-3115 can be supplied with precise positioning, which makes it possible for staff to obtain quickly the accurate location of the person in need of help and promptly arrange a rescue. Precise positioning saves time in emergency situations, saves lives and increases the safety of workers.
