Essence 5th generation

Comfortable and intuitive business 4G / VoLTE desktop phone.

New phone in an old coat

The Essence has kept its design for five generations. There is a reason for that. During the life of the Essence family, no single negative comment to its design, ergonomics or control has been received. The Essence has been in thousands of commercial projects, many of them are still active. Supplementing these projects with a model of a different design would not work well.

What's new?

New internal architecture
There is a completely new architecture inside the phone based on a modern powerful processor and an extended memory.

OS Linux
Transition to the OS Linux brings further improvements of system robustness and security and in the future it promises much greater possibilities of connection to other communication platforms.
Specific SW modifications will be significantly easier thanks to the possibility of remote logs capturing.

OTA firmware update
Now the FW update can be triggered from the phone keyboard as you know e.g. from Android, or remotely via cloud as before.
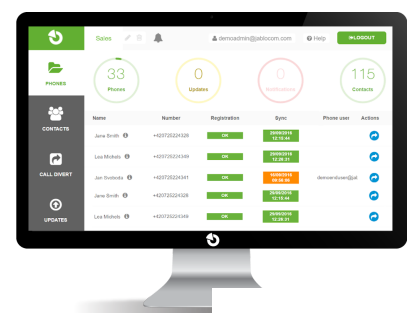

Minor improvements
Minor improvements, e.g. extended memory for saving contacts, are not as noticeable as simplified UI. The LED lights have been unified, generally flashing red indicates an activity. The control of hotkeys is as intuitive as car radio memory buttons.

Intrusion protection

High security standards of Linux OS, together with our proprietary security system, make Essences highly protected against possible privacy attacks.

Cloud administration

Jablotool.com is an easy-to-use web-console for remote control and administration of phones. Administrators get the tool for bulk registration of the phones, keeping company contacts up-to-date, setting up calling restrictions or timing bulk FW updates. You gain remote phone and messages management or access to call forwarding settings. All with just a few clicks and without fees.
